Meeting Aug 6, 2026 at 16:00 CEST

Meeting records Transcript Recording

Summary

The meeting outlined the Decentralized Deliberation Stack framework and established deliberation processes as the primary focus area.

Decentralized Deliberation Stack Overview
The framework focuses on neutral, open-source building blocks designed to improve interoperability and sovereignty in decision-making. These principles guide the development of documented implementation profiles.

Prioritizing Core Deliberation Tracks
Deliberation processes were identified as the primary focus area to establish essential documentation before technical integration. This approach emphasizes defining research-oriented profiles for specific use cases.

Ontology and Accessibility Strategies
Developing a semantic layer enables data exchange across diverse platforms. Bridging strategies allow less technical users to participate by connecting familiar communication tools to central channels.

Decisions

Aligned

- **Profiles identified as priority track** The group aligned that defining use cases and process profiles is the priority work stream for the decentralized deliberation stack.
- **Matrix adopted as neutral communication space** The group committed to using the Matrix platform as the neutral hub for communication while permitting and supporting community-led bridges to other discussion tools.

We've **updated the Decisions section** using your feedback.

Let us know what you think: Helpful or Not Helpful

Next steps

- ☐ [Elianna DeSota] Share Diagramming Language: Distribute documentation and examples of the diagramming language used for visualizing deliberation processes.
- ☐ [Simone Vagnoni] Contact Victor: Reach out to supervisor Victor to discuss the W3C standards process and share his contact information with the group.
- ☐ [Simone Vagnoni] Send Calendar Invite: Post the Luma calendar link for the scheduled ontology track meeting in the chat.
- ☐ [The group] Bridge Matrix: Configure connections between Matrix and secondary communication channels like Slack and Discord to increase accessibility.
- ☐ [Joshua Bate] Provide Matrix Adapters: Share technical details and implementation instructions for utilizing built Matrix adapters.

Details

- **Decentralized Deliberation Stack Overview**: Nicolas Gimenez introduced the Decentralized Deliberation Stack (DDS), an interoperability effort hosted as a World Wide Web Consortium (W3C) community group. DDS is defined as a decentralized process to help groups prepare decisions rather than a voting system, with a goal to define product and protocol independent profiles (00:00:01) (00:04:56). Nicolas Gimenez clarified that DDS is not a company or business partnership, but a neutral effort to develop profiles, validation methods, and open-source building blocks (00:04:56).
- **Foundational Principles**: Nicolas Gimenez outlined seven core ideals for the DDS framework: interoperability, sovereignty, verifiability, resilience, usability, clarity, and fairness. These principles are intended to manage trade-offs and guide the development of specific implementation profiles, which must be fully documented to earn a formal recommendation (00:06:20).
- **Operational Workflow and Track Structure**: Nicolas Gimenez detailed the organizational workflow, which separates concerns into specific tracks to allow contributors to work in their respective fields without needing to master adjacent areas (00:12:34). These tracks cover Deliberation Processes (facilitators and researchers), Economics/Incentives/Ethics, Ontology (semantic data and shared language), Infrastructure (protocols, identity, storage), Analysis (machine learning), and Verification (cryptography) (00:13:58). Contributors are encouraged to signal their interest via GitHub or the shared Matrix room, with the official chairs facilitating and coordinating these efforts (00:17:01).
- **Prioritization and Interdependencies**: Addressing a question from Stuart Lynn regarding track priorities, Nicolas Gimenez stated there is no fixed priority but identified the "Deliberation Processes" track—specifically profiling use cases and gathering facilitators—as the most critical starting point for the ecosystem (00:18:49). Nicolas Gimenez emphasized the need for a shared understanding of how to implement and document these profiles before moving toward broader technical integration (00:20:05).
- **Proof of Concept Development**: Stuart Lynn provided an update on a proof of concept involving the AT Protocol, Police, and Talk to the City, which demonstrated how data can be decoupled into independent servers that listen to a broadcast feed (00:21:44). While a deployable version remains in progress

due to routing bugs, the project successfully explored how deliberative processes, interface analysis, and reporting can function as independent, interoperable components (00:22:44). Nicolas Gimenez clarified that "profiles" refer to formalized, research-oriented responses to specific deliberation needs, distinct from the technical implementation proofs demonstrated by Stuart Lynn (00:23:45).

- **Ontology Development**: Simone Vagnoni presented on a proposed ontology for representing deliberation, which serves as a semantic layer based on argumentation theory (00:26:54) (00:32:31). The ontology maps various platforms, such as European Parliament debates and civic tech tools, into a shared data model to enable data exchange, analysis, and insights across different environments (00:29:07). Simone Vagnoni announced a session scheduled for 1:00 p.m. or 2:00 p.m. Central European Summer Time to discuss the ontology track, with details to be shared via the Luma calendar (00:30:47).
- **Ontology Layers and Research Objectives**: Stuart Lynn expanded on the ontology discussion, proposing three distinct layers: process description (who was involved and how), operational data artifacts (votes, statements, and summaries), and long-term evaluation (impact assessments) (00:34:35). Nicolas Gimenez underscored the importance of ensuring these frameworks are accessible to non-technical contributors, suggesting that the current lack of accessible pathways prevents the broader civic tech ecosystem from effectively learning from and collaborating with Decentralized Autonomous Organization (DAO) governance models (00:35:56).
- **Process Documentation and Community Gathering**: Elianna DeSota reported on recent efforts within the Metag group to document various deliberation processes, having analyzed ten additional cases at a recent Tokyo conference. The team is creating a diagramming language and a handbook to compile these structures, which assists in forward-looking iterations of process design and allows for better connectivity between different tools used by these groups (00:38:35).
- **Communication Platforms and Bridging Strategies**: Stuart Lynn raised concerns regarding the accessibility of Matrix and Element as primary discussion spaces for less technical users. Nicolas Gimenez explained that the group intends to remain neutral and community-friendly, allowing members to bridge their existing platforms (such as Slack or Discord) to the central Matrix

channel (00:40:57). Joshua Bate offered to provide existing adapters that allow agents to bridge Matrix with other platforms like Telegram, Slack, or Discord, which Alessandro Oppo noted addresses the recurring theme of interoperability (00:42:41).

- **Global Expansion and Formalization**: Stuart Lynn noted interest in the DDS framework from workshop attendees in Japan, South Korea, and the Philippines, indicating potential growth for the group (00:43:45). Regarding the path to formalizing DDS as a W3C working group, Simone Vagnoni noted that this process involves structured deadlines and potential participation fees for member organizations. Nicolas Gimenez suggested leveraging the expertise of the supervisor mentioned by Simone Vagnoni to guide the transition from a community group to a formal standardization track, with the possibility of inviting that individual to a future call (00:46:18).

Meeting Aug 6, 2026 at 16:00 CEST - Transcript

00:00:01

Nicolas Gimenez: So, hi everyone. Thank you very much for joining the first DDS open call. Uh my name is Nicholas Nunes. I work on a Agora. And I will be presenting now the essence of what I think um DDS represents for for me and uh what this W3C community group has came to be throughout the many informal calls that we already had uh a couple for for a couple of months. So DDS is stands for decentralized deliberation stack. It does not impose any universal system. The goal is to define products and protocol independent profiles. Then recommend this tested implementation profile for specific use case. So that seems very right now but it won't be at the end of the presentation. Um first let's me let me describe what is the first D means deliberation at least for me. The deliberation is a structured process that helps a group prepare a decision. Uh people will consider different information and perspective make agreement disagreement and then the whole group will develop some kind of collective understanding of themselves.

00:01:27

Nicolas Gimenez: So it's not exactly an open discussion. It's not completely uh chaotic but it's related and it's not as well a final decision. It's not a vote. So even though voting, polling, ranking, ranking can be used as part of deliberation, it is not uh where the the the goal of DDS to describe voting system more when it comes to decision the final decision that that's where it stops basically. Um so many people already work on this problem of deliberation. Deliberation has a lot of different aspects but the work is is

fragmented. Everyone have their own community which is normal which is which is fair. We have facilitators who understand deliberative processes. We have civic tech builders who understand products. We have semantic protocol identity or cryptography experts who who understand infrastructure. And the goal of DDS is trying to connect this their work without requiring everyone to understand every each other's field. So, we're not uh as a as a as a semantic web expert, for example, I'm not going to be necessarily interested in all the intric intricacies of ad protocol.

00:03:02

Nicolas Gimenez: Uh if I'm if I'm interested in activity pub, I'm not interested in adds started again actually with the protocol ad protocol for decentralization. uh but following um feedback from the community and especially from uh the activity pub community through Simone Vagnoni. um we realized that uh it it's not it's it doesn't make sense to create a standard for version if this uh uh and push one specific protocol when different communities already have different preferences. Uh that's why DDS has now become protocol agnostic. So DDS the word DDS actually was coined by puja uh that eno initially to launched uh a standard and uh and then uh for a small story we had a lot of informal discussions so I just launched a website dds.xyz XYZ and many people across different uh communities uh were very interested in it especially I want to thank Metag's data mesh group with with Lê Nguyên Hoang who is here there and also CIBC's from ARM uh where I met Simone Vagnoni as well as the govak ecosystem um we had a lot of discussions informal discussion with all of these different groups and that's what changed the how the initial DDS uh uh was is present what is currently presenting on on the website and is going to be pres is going to become.

00:04:56

Nicolas Gimenez: So before we dive further I want to explain what DDS is and what DDS is not. So DDS is not a company. It's not a business partnership. It does not

prescribe political model or protocol. It is um the the it is it is a public interoperability effort that is meant to be neutral. It develops profiles, validation methods, tests, specification and reusable open source BD blocks. And it may recommend a complete implementation profile. I will explain what it means later when the evidence is sufficient. But it does not certify any products. Um so the goal uh it's not yet a working group. It's just committee group. Anybody can start a community group. The goal is to really become a working group following the W3C recommendation. Uh uh we just see recognition track. Um, so if the the version is so complicated, how do we bind everything together? So what is DDS if it's just an it's not it's not meant to be just an enumeration of of what you all working on.

00:06:20

Nicolas Gimenez: So there are certain ideals that uh the DS decides um to uphold and I originally coined four of them but speaking with you and and advancing the idea added three more. So interoper interoperability I think is selfexplanatory is just uh how to interoperate between different tools between different teams and so on. Sovereignty is not only sovereignty of communities but also sovereignty of individuals having agency over that their data. Verifiability is uh being able to audit cryptographically or not the results or process. So not necessarily technically but also out outside of of purely digital uh the process of deliberation. Resilience is about uh the workway tests credible exit. So possibly the the idea that if one of the uh aspects of the vibration when the server is down the whole thing goes no doesn't go down. So goes bankrupt well it can continue. Uh if so uh so they also like the open data open source here. Um and then I added three more. So usability I think is very important. This is actually why originally I had chosen ad protocol but it's just my personal preference.

00:07:52

Nicolas Gimenez: Uh it's it's that participants and people should not be expected to have specialized knowledge uh outside of the use case that they are in to participate. Obviously different use case different context but generally speaking it's something we should aim for. clarity is very also very important as as you know like we all come from different committees we all come from different backgrounds uh uh it's not the the goal of the DS is not to impose uh a standard because it just doesn't work just you adapt to different committees adapt to different use cases by being open about it and then fairness is more about economical sustainability that is very very complex uh issue and it's like I said it's not a company or whatsoever but it's an interesting field of research as a community. So how do we make all of the collective efforts sustainable in a fair way? So obviously these are just ideas and uh different implementation of DDS or uh will not will not it will not be perfect. So, so, so there will be trade-off but the the point is that we try to limit this trade-off and when they are the idea is that they should be documented the limitation should be explained and and documented for it to become a recommendation.

00:09:28

Nicolas Gimenez: Um, so how do do we work how how do we work uh what is the flow? So like a product I come from a builder perspective you know I'm I'm really founder so I think we all can agree here that nothing makes sense if we don't have use case if we don't have users if you don't have adoption so everything start with uh facilitators that provide context civic tech practition pract civic civic civic society partitioners whatever use case whatever thing we are what's free but something concrete and with a expert in this field they will describe the the flow the process and so on and so that's the profile so a profile is really okay we come with the use case we come with the context and then let's come up with a how do we have impact how do we make the best deliberation or one possible best post deliberation There can be many profiles right for the same use case uh uh uh to answer that that use case and this profile very importantly should be product and protocol independent. So at this point it's just you know uh flow ontology these kind of things but not uh using specific product and then you can have developers like me that can come up with uh draft implementation profile that include a lot of different uh technologies or also other things.

00:11:11

Nicolas Gimenez: Finally uh you have researchers, users, communities uh that will validate the process and the draft implementation profile and that can become then recommended. So you you both have to actually this is a bit wrong. We have we have to agree on on on how to provide recommended profile and then to agree on how to recommend recommended implementation. But with plat mind there will be a lot of profiles there will be a lot of uh uh implementation and there will be of course there are a lot of use cases. Um, yeah. I just realized that I did not send you the slides. Uh but the slides going to send you on the um uh on the chat. They are here. So in case you want to follow um um so yeah um continue. So yes, now all of the things are are pretty pretty uh uh uh complex like you can see. So so we're not going to be able to just sit in this room and discuss and talk and solve all this.

00:12:34

Nicolas Gimenez: That's not how how it works. We already work uh in different ways. There are already many amazing communities uh that are like already like that already mentioned that are working to solve these problems. But in a within DDS the idea is to to separate concerns. So tracks I will be explaining what what they are. Then there are scope. So it's uh a work item. It's it's it's a context within a track. It's a bit this is a bit abstract. You will see when I explain uh what uh the first track. But the idea is that contributors can work deeply in their field without knowing or understanding everything. Um so the first track is maybe at least I think to me the most important actually. So the deliberation processes this is intended for which kind of contributors facilitators debate deliberation research researchers I already talked about it you can have a proposed scope so scope is uh uh the different aspects of the this track and then a work item is is very very specific.

00:13:58

Nicolas Gimenez: So for a specific context I I I I have a specific use case and I I I want to answer how to uh do the theation for uh city comput conf comput conf comput conf comput conf comput conf comput conf comput conf comput conf comput conf comput conf computation and then the out the output is something very concrete so it's it's like a a report at the end doesn't matter how these people organize themselves but they should come to present at the plenary. So here or on GitHub or on the share GitHub or on the share matrix to inform the community about what they learned so that other people with other expertise can come and and give their their opinion. Um the track number two is for uh economics incentives and ethics. So that's what I was talking about earlier. I think it said explanatory. So, how do we make this community more uh fair and how do we fund all of this? The third one is ontology. So, ontology is semantic data. So, how do we create a glossaryy so that uh different tools don't reinvent the wheel all the time and can reuse this uh share language to be interoperable.

00:15:29

Nicolas Gimenez: The fourth track is a bit more wide. So it's like infrastructure. So we have protocols like app protocol activity pub solid so many different things. Identity so authentication kind of things storage can be u permanent storage on IPFS or other stuff. And so this is uh obviously not created in a vacuum. The idea is that this track this infrastructure work is going to work on a profile again that was originally um shared by the first track. You know first the first track is responsible for informing the profile that others are then trying to solve basically especially ontology and infrastructure. are more tech oriented then the so we have analysis so this is all ML you know machine learning AI all of these things how do we create the best algorithms uh depending on different contexts obviously it's not nothing none of this is independent of of the rest obviously it's highly dependent of the product but uh there's a track for this as well

verification is about uh cryptography So how do we bring how do we create something that is um that require less trust.

00:17:01

Nicolas Gimenez: So for participant not to have to trust as much the third party provider and can just use cryptography to verify the correctness of uh an analysis for example. Finally so that's that's it. This is the whole track. So how do we organize ourself? Uh simply said uh we follow mainly 90 90% is just the W3C standards. So we we follow whatever the W3C community group impose on us to become to be uh a community group. But then uh with something in mind that I I mean it's important to so the idea is have a some sort of uh chaotic organization so that people in different tracks just hey I I'm interesting in working on this so What? work on this you can uh manifest yourself on on GitHub on on on matrix room here in this plary and then the chairs so the official chairs of this uh committee group will help you it's the role of the chair to facilitate and you can create open calls on luma here on the chair calendar if you want or obviously you can use your own your existing community as well it's fine as long as you come back to the neutral uh uh W3C group later to um uh um inform and uh to request for to request the rest of the community for input.

00:18:49

Nicolas Gimenez: So like I said, that's the way to join. Um I actually already said all of this. This is the end of the presentation. Um, do you do you have any question on anything I said? Is it in line with uh what you expected of DDS also? Uh, I have to expand this. Startling. Okay. Start. Yes.

Stuart Lynn: Yeah, this is this is a great Nicolas. Thanks for bringing this all together and it makes a lot of sense and um I think um it makes a lot of sense to me. Um I'm wondering if you think that there if you think there are some tracks that we need to kind of uh focus on or recruit for um initially to kind of get things moving. It does feel

that there's like an interdependency between some of these that we'll need to kind of bootstrap some of the work streams before others can kind of um start to pick up speed. So yeah, I'm curious if you've thought about kind of where we need the the most attention in the different work streams um as we sort of begin to build this

00:20:05

Nicolas Gimenez: Thank you for your question. So um I think no there is no uh uh priority at all. I think everybody is already working on on all all the aspects. Um I just think that the what's lacking in the ecosystem to me is is is this really is putting all of it together rather than um any particular priority. Um because like for me my priority is maybe app protocol because I like app protocol whatever for whatever reason I have but someone else okay I don't I don't care about this I I work on something else. Uh my use case is large scale con consutation. I think maybe if I have to say one, I would say the first one, the profiles. So defining the different use cases and profiles, getting facilitators together, researchers together to define all of these use cases to define all these profiles that would be amazing. I think that has never been done. I don't see any public information about this. So Flo I see your question. Uh I think do you have any example of which you could explain the interoperability profiles and so on?

00:21:44

Nicolas Gimenez: Yes, I think Stuart has one. Stuart has is an amazing engineer and he provided already a proof of concept on ad protocol between police and talk to the city for a specific use case. So I think maybe uh if you want to share about it swap I think this is a good

Stuart Lynn: Yeah. No, it was it was mostly just a a proof of concept that we were trying to to um explore

Nicolas Gimenez: example.

Stuart Lynn: with this this model. So we we we took some subset of the ontology that we've been talking about and turned it into AT protocol lexicons um and built some uh client libraries around those and then sort of tried to imagine what it would look like to break pull this out into a number of component parts that ran as independent servers that just consumed the AT protocol feed as the way to move data between them and make them kind of less reliant on each other and then also kind of brought in talk to the city as a as a third or a um uh uh uh you know add-on there.

00:22:44

Stuart Lynn: So the the idea was to have you know the way protocol works is we store data in these personal data stores. The data gets broadcast to the network and then the various different applications can listen to that broadcast and do something with it. And so the idea was to see how much we could decouple a deliberative process in terms of its interface analysis and reporting out into different uh sections that listen into that. So yeah, really just a proof of concept to see kind of if this um idea had legs. I keep meaning to get around to deploying it somewhere so everybody can play with it. It does work, but um I need to work out a couple of bugs in the um the the uh the routing to get it to to be deployable somewhere. Um but yeah, you can find that flow in the GitHub under under um test cases, I think.

Nicolas Gimenez: Just maybe the profile is not defined here. profile is uh really something in my mind about more like use case like what kind of use case does it answer to so that's not necessarily defined so in your

00:23:45

Stuart Lynn: Yeah.

Nicolas Gimenez: case it's more like the implementation so you have implemented something uh that prove interoperability and all of these values alo this principle but

there is no concrete okay what does it mean to what's the point of of of doing police and talk to the city? That's that's what I mean by profile

Stuart Lynn: Yeah, I think that's that's a question I had. I guess Nicholas, when you think about it,

Nicolas Gimenez: basically.

Stuart Lynn: because one of the things to me that like the standard and decentralizing in this way really means is that you can start to um plug and play different components that we have um across the distributed network to accomplish really interesting things. And I'm I'm curious about do we use those profiles to kind of inform missing gaps within the ontology within functionality? Um or do you see those being kind of central to like these are the kind of the the the approved kind of like engagement profiles of DDT?

Nicolas Gimenez: Um so profiles are for me more formalized research oriented uh answer to a pragmatic concrete um need of a deliberation in some context.

00:25:05

Stuart Lynn: Mhm.

Nicolas Gimenez: So that's not really um builder or pragmatic in the sense of

Stuart Lynn: Right.

Nicolas Gimenez: of of uh us as developer or something like this. It's I want to bring researchers to provide I want to bring users to provide feedback as well as to okay how how how do what kind of process they want that's that's the profile but obviously we already have the profile because we already have use case we have some adoption but the ecosystem have very limited adoption when you look at it so so that's also something I'd like to

Stuart Lynn: Yeah, that makes sense.

Nicolas Gimenez: Is that more clear for for you or Flo?

flow: Yes. Thank you.

Nicolas Gimenez: Yeah. Anyone else has a question? Otherwise, we can go for the next presentation uh on ontology. Oh, just uh want to say something. Okay. So, I guess

that was clear. Um um Simony, do do you or I don't not know exactly uh what is supposed to be next um but I think it's Simone Vagnoni, right?

00:26:54

Simone Vagnoni: Uh yeah, if you want I I do a short presentation.

Nicolas Gimenez: Okay.

Simone Vagnoni: Sorry. Okay. Uh okay. So uh I what uh for me okay let's start with something that I've uh uh already shown to some of you but it's uh the uh the the ontology that it's basically a data model to represent uh the the liberation. It's one way of of representing deliberation and uh I did it last year with in my PhD research uh taking from some existing ones that was that were in the in the literature and uh but no one of of them was uh online and maintained. So I uh did this and it's very it's minimal and you can find it on online uh what uh the as um also for for the for answering the the question before about interoperability the uh one uh one point in which we should agree when we exchange data is for sure the the format the the semantic uh format that uh the that then it's represented in a data model. In this sense it's there is a minimum the the structure that is uh the process model that describes the the the liberation process for example uh with the deliberation result the topic the stage the participants and uh the contributions that contains arguments and uh upon that we can do a lot of beautiful NLP analysis and uh and and different uh insights.

00:29:07

Simone Vagnoni: uh for example uh I mean it is I'm trying to be as not not as confused as I I am due due to the flu but uh what I I did is map the different uh platforms like European parliaments debates transcripts gracripts and others like the CDM the pol and others and you can uh like uh do the same for like with your mod data model. The the fact is that I mean this is one way to represent it and uh we should uh agree in in a way to uh what to do with that. So everyone is uh is using uh at least a compatible uh

semantic data model. So we can uh together uh use uh I mean exchange this data and make analysis for example to track uh our deliberation uh about a topic in uh in a local environment like in a local citizen assembly to the parliament of super national or between citizen assembly to exchange data and and insight and one something that we can do for example It's I did add um a semantic engine search engine for searching for uh for this like all the processes that I dumped and mapped on the same ontology.

00:30:47

Simone Vagnoni: it's uh can be retrieved from the different platforms and uh and described in a knowledge graph for example like uh like that or uh having the this retraceability this is just what something that we can do also topic mapping topic modeling for understanding which are the the the topics more and more talked about etc. Why I talk about this? because uh tomorrow with Stuart uh we will uh start discussing the ontology track for uh convening together on what will be uh the the best to make a let's say standard way to represent this information returning here for u for having an uh shared data model and uh and also infrastructure structurally speaking uh that could be used both in uh for example uh atro and activity pub because they use a different format for example one use flexigon one use JSON LD that stand for link data that is also used by semantic web community like in this in this sense so We uh tomorrow at uh uh 1 uh 1 p.m. uh our uh England hour or uh European Central Real summer time.

00:32:31

Simone Vagnoni: It's 2 p.m. But there is the Luma calendar. I will send it later on on the chat. So if you want to join and talk about and the liberate about that uh please uh let feel free for every question just uh

Nicolas Gimenez: I I have one. Um um I think that how did did you decide to create this ontology? Like what um did you base your ontology on existing police? Like

because there's police that is used then you create police like what's the what's the use case basically the profile here?

Simone Vagnoni: the Um what I was thinking about when for that was the semantic layer the semantic uh description of uh the deliberation itself based on argumentation theory. So Walton's argument argument schemas and uh but practically to to decide which uh uh um uh nodes used for describing it. Uh I was uh I was thinking about which which are the platform that exist and map to a um common uh similar uh entity and also based on what previous work uh did that all all of that is documented on on the page and I will put it uh on here too.

00:34:35

Simone Vagnoni: It's

Stuart Lynn: Yeah, I think I think digging into Nicholas your your idea of profiles,

Simone Vagnoni: yours.

Stuart Lynn: I think there's there's a couple of different profiles that the ontology kind of serves. Um, and there's probably more than I'm going to list here. Um but at at one level it's kind of like how do we describe different processes consistently so that we can start to really ask questions about them um and compare them much what someone is doing with the the exploration tools um where you can start to really understand okay well what was the what was the delivery process that happened who was invited um how is it convened like all that information which I think is is one level of the ontology there's I think probably a second level which is one I've been kind of working on more which is like what I think of as the operational or like the the data artifact part of the ontology which is like what gets produced at different steps in a deliberation right so those are the things like statements votes um you know maybe analysis outcomes like groups um summaries that kind of thing and then I think there's probably a final layer which I don't think MD here's touched upon much which is the evaluation like um like focus ontology um components which are things like you know um how well did this deliberation actually capture the the um the the community is deliberating over his views like what kind

00:35:56

Stuart Lynn: of happened long term because of the liberation ation kind of those kind of outcomes and and learnings that occur as part of the liberation and those can those can offer those can really help with different profiles of use cases right there's a sort of research type use case where you want to look over the impacts of of deliberations you know filtered by a certain deliberation type which would be supported by that there's the kind of operational profile where we want to build different tools in a way that they can data from the process um in a consist consistent way and and produce data that could be consumed by other tools. But yeah, I think I think as we start to like feel the ontology, we're going to see these kind of natural kind of boundary layers between the different um different profiles and different use cases there. That that helps or make sense?

Nicolas Gimenez: Yeah, I just I I think that um as a community um we need a way for nont techch nontechnical people to join and um provide their in their own words their needs so that like we cannot we don't reinvent the wheel every time someone is because like right now the in in the in the web three community for example the DA community is trying to learn from the uh civic tech ecosystem on how to govern Dows.

00:37:31

Nicolas Gimenez: So this is just an example like is that possible really is the same context? Yes, maybe a little bit but not exactly. So h how do we uh formalize this? How do we invite experts because they are experts uh on this to come and and and write and and in a way that every everybody and not just technical people can understand. That's that's what I think is lacking.

Stuart Lynn: Yeah, that makes sense. Um, Lê, do you want to talk a little bit about the work that Metab's been doing on the kind of the process diagramming and the the capturing of processes there? because I think that's relevant to what you're you're talking about, Nicolas, which is like there's been this effort with the Metag to kind of uh

collect together um many different deliberation uh like deliberations that have been held um there and then sort of really sort of document their structure kind of like how many people were involved at each step, what was happening there, what tools were used and all that good stuff. So that that could be a good starting point for creating a library of of these use cases that that inform the the rest of the sort of technical buildout.

00:38:35

Elianna DeSota: Yeah. Um, not much to add there. Thanks for over that. Yeah. I think there's like we just gathered another 10 over the past uh recently in a in a conference in Tokyo kind of talking to folks. A lot of it was retrospective. Um, so people were like, "Here's my process. I'm going to diagram it out and demonstrate what happened. But then throughout the process we were kind of going through also prospective of like what would you need to implement if you were to do this in a better way next time. And so it was both reflecting on the actual practice process that existed and then doing it in a forward-looking way of how do we then use this information to iterate on the prior um work that was done. And then also just kind of uh yeah trying to figure out how we connect different tools within those groups if they need them or alternatively for them to work on whatever updates they want. Um the like timeline on that I will mention.

00:39:32

Elianna DeSota: So there's two things here. One there's like a diagramming language that we're using so it's extremely clear and we have like a way to compare processes across every single process. Um and I can see if I can send that along at the end of this. Um and then the second part is we're trying to gather this kind of a compilation of the folks who are um who are running processes and wanting to learn more and interact more with tools so that there's kind of an overall book handbook situation that um that demonstrates all of these different processes. And then the process builders

themselves are right now kind of ephemerally in metag orbit, but it'd be great to have that more tapped in for sure. So that then we're iterating on the specs that we're building

Stuart Lynn: I guess not directly. Um, oh, sorry, Humphrey, you've got a question in the chat, but maybe that's just in the chat. Um the I guess just on the point of like wanting to bring in nontechnical people into the collaboration um I'm wondering if we think kind of um using matrix and element as the kind of core discussion space is a locker for that for some slightly less pical people.

00:40:57

Stuart Lynn: I feel it's a I love element I love matrix I love the decentralized chat space. I'm wondering if there's a that that then becomes a barrier though to folks who are a little bit less techsavvy just as a we we talk about this at the end. This is more of a process question and a kind of community question but like I just want to name it here because I've thought it a couple times now.

Nicolas Gimenez: So I think in terms of tooling um it's like we we all have our existing communities you know Metag has slack CIBC has a the uh we use discord um it's it's not um the this this this group is just uh it's very important for it to remain neutral and remain uh as simple as possible and and because it's a WC community group so which is basically Simone even wanted to use only email for so so that's uh besides metrics is interesting because if anyone any community member want to create bridges to uh slack met they can if they can they can create a channel uh there will uh actually bridge the that's why metrics I find interesting but the problem is obviously the time like which community member wants to do that it's up to you guys I personally don't don't have the agency but I that's why we chose metric But uh I think the these conversations can can can happen um can happen in a very diverse way in very poor way in different places so long as at some point

00:42:41

Nicolas Gimenez: um there's a GitHub issue or something you come to the penary here and you somehow discuss this in a more formal way then it is good. This is the that's how I see it personally. I don't know what you think, Lê and Simone or others.

Elianna DeSota: Yeah, I think that's accurate. Um, there's a million chats there. At this point, I've had difficulty making any decisions around chats.

Stuart Lynn: That's fair. I think I think with the um I think with the idea of bridging into those communities um through matrix, I think that sounds like a good idea. Perhaps we can perhaps wonder of us can find some time to to sort of uh start start that process because I think it's I think yeah, I think it's important to meet people where they are in terms of of their their communication styles. And I think uh that would help with the the folks who are coming at us from a non nontechnical aspect.

Joshua Bate: We have some built adapters for matrix um for like our agent frameworks.

00:43:45

Joshua Bate: It turns it into something agents can read. So happy to show you you know you guys can use that um and connect it up to Telegram, Slack, whatever Discord.

Stuart Lynn: There you

Nicolas Gimenez: Thank you so much.

Stuart Lynn: go.

Alessandro Oppo: Because it's actually M bridge also that provide all the connectors all the bridge between different several shots and this remind me that is you know always the same problem about interoperability and protocols.

Stuart Lynn: Yeah. Um, speaking of Asian um, uh, users, um, we presented a little bit of this idea um, not quite as fleshed out as Nicholas has, but kind of more the the basic idea to, um, a bunch of, um, people working in, uh, Japan, South Korea, the Philippines,

um, at a recent workshop in Tokyo that we just got back from, which is why me and Lê might be looking a little bit exhausted. Lê looks great. I look terrible. Um, but like, um, it was it went down really well. And there may be some folks from from sort of the uh various Asian countries who might want to join this this group as well.

00:44:57

Nicolas Gimenez: Yeah. The idea is is really not to replace any form of to be competing with any existing communities. There are a lot uh there's also Batcon's police like Discord group which is like quite amazing. It's where I met many of you actually. Um there is a lot and it's not about uh adding one more. It's more about trying to formalize this into something uh uh more structured and and then through also a very reputable process which is the brute we see with the with the along uh you know structured um work of of standard standard standard digitization but without falling into the into the mistake of saying okay I won't impose using whatever uh technology or whatever uh product whatever way because that is not going to work. That is not just not how people adopt uh standards especially in this space. Yeah.

Stuart Lynn: just just so that we've got a guiding light as well. Um, Nicolas or Simone, do you can you give us a brief overview of how we go from a a community group in WC3 to like a a more formal standards group?

00:46:18

Stuart Lynn: Like what are the what is the steps in the process that we should be keeping in mind as we work on this?

Simone Vagnoni: Um I'm not an expert on that. uh was what I know it's what my supervisor uh told me after 20 years of experience and uh the there is a need of structured deadline and also uh the participants should uh be subscribed to uh the W3C and at least their their organization. So um um so also there is like a a fee to to participate in a the working group. Maybe also we can the create the the specification

and someone uh more like uh uh that work on that will take our work and formalized or maybe someone some of us will do it when we have uh like the this all the specification made for uh for what we want to to standardize this for what I understood Okay.

Nicolas Gimenez: Thank you, Supervisor Victor was here last time. Uh, unfortunately, I would I would have loved to talk to him more. Uh, maybe it's worth having um if you can uh share with me his contact over there.

00:47:55

Nicolas Gimenez: So I don't know like but it's it will be interesting. thing or if you can send an email maybe to the public uh W3C group to to inform on on this or I don't know uh that will be or you can send an email following discussion with him uh that will really help us a lot. It's very valuable to have someone like uh like him in the community.

Simone Vagnoni: Yeah, he he said that uh would help us and uh we can help ask him if he wants if we'll uh participate next call too. But yeah, also writing a mail

Nicolas Gimenez: Okay. Is there anyone else wanted to make a presentation? Um maybe before we stop the recorded uh call and we can have more informal chat or it's done or anything else to add. Okay. So, thank you so much for attending the the first kickoff open call and see you for the next time. I will not

Alessandro Oppo: See you. Bye-bye.

patcon: Yeah, thanks for

Nicolas Gimenez: Oh,

patcon: hosting.

Nicolas Gimenez: wait, wait. I just I was just saying that for the recording. I'm trying to stop the recording.

patcon: I

Nicolas Gimenez: Okay.
