W3C DDS COMMUNITY GROUP

Decentralized Deliberation Stack

DDS helps deliberation tools and communities work together without imposing one system. It defines product- and protocol-independent profiles, then recommends tested implementation profiles for specific use cases.

First Plenary Open Call · August 6, 2026

Deliberation prepares decisions.

People consider information and different perspectives.

They make agreement, disagreement, and trade-offs visible.

They develop collective understanding.

Deliberation may use polls or rankings. A formal vote can follow as a separate step.

The work is fragmented.

Researchers, facilitators, builders, and technical experts often work separately.

Their tools use incompatible concepts and formats.

Communities become dependent on providers.

Teams keep solving the same problems.

We started DDS with AT Protocol.

It was our concrete starting point.

The community brought other protocols, tools, and perspectives.

We expanded the scope.

DDS is now protocol-agnostic.

DDS is a public interoperability effort.

DDS develops specifications, profiles, validation methods, tests, and reusable open-source building blocks. The group may recommend a complete implementation profile when the evidence is sufficient.

DDS does not develop or certify products. Products can implement the work, test it in context, and return evidence to the group.

DDS is not a company, cooperative, or business partnership.

DDS does not prescribe one political model, protocol, or architecture.

DDS is not currently a W3C Standard. Our long-term goal is to incubate the work in this Community Group, charter a W3C Working Group, and advance mature specifications through the W3C Recommendation Track.

PRINCIPLES.

Interoperability.

Tools exchange information without losing meaning.

Sovereignty.

People and communities retain agency over their data and process.

Verifiability.

Processes and results can be inspected.

Resilience.

DDS favors credible exit: where relevant, communities should be able to recover identity and data, then continue elsewhere if a provider disappears.

Usability. NEW

People should not need specialist knowledge or accept worse UX than they expect from the best everyday apps.

Plurality. NEW

Different use cases and contexts have different needs.

Fairness. NEW

Who pays, benefits, bears burdens, and holds power should be transparent and fair while the ecosystem remains economically sustainable.

These are ideals we uphold. Different use cases will make different trade-offs.

From a use case to a tested implementation profile.

1. Use case.

Describes the context, participants, process, and intended outcomes.

2. Profile.

Product- and protocol-independent. Defines required features, flow, ontology, broad UX, safety, economic, ethical, and technical expectations.

3. Draft implementation profile.

Applies the profile using concrete products, protocols, and technical architecture. It remains a draft until validated.

4. Validation.

Tests, audits, applied research, and real-world use produce evidence appropriate to the use case.

5. Recommended implementation profile.

The complete validated package: independent profile, concrete bindings and implementation guidance, tests, evidence, and documented limitations and trade-offs.

The profile stays independent. A recommended implementation profile is concrete and tested for a specific use case. It is not product certification.

Tracks separate concerns.

Track. Groups contributors around one related area of work.

Scope. Defines which work belongs in the track.

Work item. One concrete task, such as recruitment guidance for a city consultation.

Output. The result of a work item, such as a recommendation or test.

Plenary. Reconnects the tracks and decides shared DDS work.

Contributors can work deeply in one track without mastering every field.

Track 1: Deliberation Processes.

Intended contributors.	Facilitators, deliberation researchers, civic organizers, accessibility experts, and public-interest practitioners.
Proposed scope.	Use cases; process features; digital and non-digital steps; participation rules; facilitation; rounds; moderation; accessibility; decision handoff.
Example work item.	Describe how a multi-round city consultation works: what happens in person, what happens digitally, who participates, and how the rounds connect.
Possible outputs.	A use-case brief, process map, facilitation pattern, or feature requirements that inform a profile.
Plenary connection.	Share participant, organizer, and process requirements that inform the profile.

Track 2: Economics, Incentives, and Ethics.

Intended contributors.	Economists, political scientists, legal scholars, game theorists, ethicists, community-currency designers, open-source maintainers, and funders.
Proposed scope.	Institutional design; legal constraints; participation incentives; game theory; community currencies; economic sustainability and fairness; open-source funding; business models; distribution of costs, benefits, burdens, and power.
Example work item.	Compare funding and incentive models for sustaining an open-source deliberation ecosystem without provider lock-in.
Possible outputs.	Economic and institutional criteria, an incentive analysis, funding pattern, fairness assessment, or ethical risk assessment.
Plenary connection.	Add viability, fairness, incentive, power, legal, and ethical constraints to the profile.

Track 3: Ontology.

Intended contributors.	Ontologists, knowledge-graph and linked-data experts, and domain modelers.
Proposed scope.	Core concepts; deliberation lifecycle; participation; provenance; mappings.
Example work item.	Define a shared ontology for a city consultation, then map it to JSON-LD and AT Protocol Lexicons.
Possible outputs.	A glossary, ontology, schema, mapping, or example dataset.
Plenary connection.	Add formal concepts and mappings to the profile.

Track 4: Infrastructure.

Intended contributors.	Protocol, identity, storage, infrastructure, and application developers.
Proposed scope.	Protocol bindings; identity; portability; archival and recovery; applications; bridges.
Example work item.	Build a draft ActivityPub implementation profile, archive its records independently, shut down the original provider, and recover through another implementation.
Possible outputs.	A draft implementation profile, export format, protocol binding, archival adapter, migration tool, recovery test, or reference application.
Plenary connection.	Submit draft implementation profiles and infrastructure constraints for validation.

Track 5: Analysis.

Intended contributors.	Deliberation analysts, data scientists, ML and qualitative researchers, facilitators, and evaluation researchers.
Proposed scope.	Clustering; summarization; sensemaking; metrics; bias; human review; ML evaluation.
Example work item.	Compare clustering and summarization methods on the same dataset, then evaluate the results with facilitators and users.
Possible outputs.	An analysis method, open pipeline, benchmark, result schema, or evaluation report.
Plenary connection.	Provide analysis methods and results that implementation profiles must expose and evaluate.

Track 6: Verification.

Intended contributors.	Cryptographers, reproducibility researchers, security engineers, auditors, and formal-methods researchers.
Proposed scope.	Deterministic re-execution; provenance; result commitments; audits; proof systems; zkML.
Example work item.	Verify a clustering result by deterministic re-execution, then test a zkML proof of the same computation.
Possible outputs.	A validation plan, test suite, audit method, commitment format, evidence report, or proof-of-concept verifier.
Plenary connection.	Report whether a draft implementation profile has enough evidence to be recommended.

Governance.

Contributors.

Contribute needs, research, specifications, code, and review.

Maintainers.

Trusted Contributors who steward repositories, documents, tools, and operations.

Chairs.

Facilitate discussion, consensus, and the W3C process.

BDFL.

Protects project continuity in operations, not specification authority.

Review requested.

Review the public governance agreement on GitHub. Propose changes there or discuss them in the DDS Matrix room. Specifications and profile recommendations follow Community Group consensus and W3C process.

Join. Then self-organize.

Join.

Join the W3C DDS Community Group.

Start.

Open a GitHub issue or a Matrix thread for a specific need.

Meet.

Create a focused recurring call on the shared Luma calendar, like the Ontology call on Friday.

Return.

Share decisions, open questions, and learning with the monthly plenary.
